

6 Reasons

You Should Be Considering SASE Now

(Secure Access Service Edge - Simplified, Scalable, Secure)

The world of work has changed - but has your network kept up? As businesses embrace hybrid work, cloud apps, and mobile users, traditional network security models are breaking under the weight of complexity. Firewalls alone can't protect what they can't see - and VPNs are slowing everyone down.

SASE (Secure Access Service Edge) combines network connectivity and security into a single, cloud-delivered framework. It's how modern organisations keep people, data, and systems connected - securely and seamlessly - from anywhere.

If it's not on your radar yet, here are six reasons it should be.

1

Your users and applications are no longer in one place

Workforces are now distributed across offices, homes and cloud platforms. Traditional network models struggle to secure and optimise this environment.

SASE delivers secure access to applications from anywhere - for any user or device.

Legacy network and security stacks are too complex

2

Many organisations run multiple point solutions across networking and security, creating operational overhead and visibility gaps.

SASE consolidates networking and security into a single cloud-delivered architecture.

3

VPNs and backhauling reduce performance

Routing traffic through central data centres adds latency and degrades the user experience.

SASE connects users directly to applications through globally distributed security points.

4

Security must follow the user - not the network

Modern environments require identity-based security rather than perimeter-based controls.

SASE applies consistent security policies to every user, device and application.

Cloud adoption requires a new security model

5

As applications move to SaaS and cloud platforms, traditional network security becomes harder to enforce.

SASE protects cloud access with integrated controls such as secure web gateway, CASB and zero trust access.

6

IT teams need simplicity and visibility

Managing multiple vendors, appliances and policies creates operational friction.

SASE centralises policy, monitoring and control into one platform.

Why Act *Now*

Adopting SASE isn't about buying another security tool - it's about future-proofing your business.

The longer legacy systems stay in place, the harder it becomes to integrate modern capabilities and maintain visibility across the cloud.

SASE helps you move from managing complexity to delivering clarity.

Start your journey with a SASE Readiness Review from Vizst Technology - a Diamond Palo Alto Networks Partner.

We'll benchmark your current environment, identify where SASE can deliver the greatest impact, and design a roadmap for a simpler, more secure network.
